*- George Washington University report: Counting for Dollars 2020: The Role of the Decennial Census in the Geographic Distribution of Federal Funds (<https://gwipp.gwu.edu/counting-dollars-role-decennial-census-geographic-distribution-federal-funds>)

LUCA: A little work could pay big dividends

1 mill conversion with 283 units and 1 to 2 residents per unit = ~ \$10 million in federal funds to state and local governments between 2020 and 2030

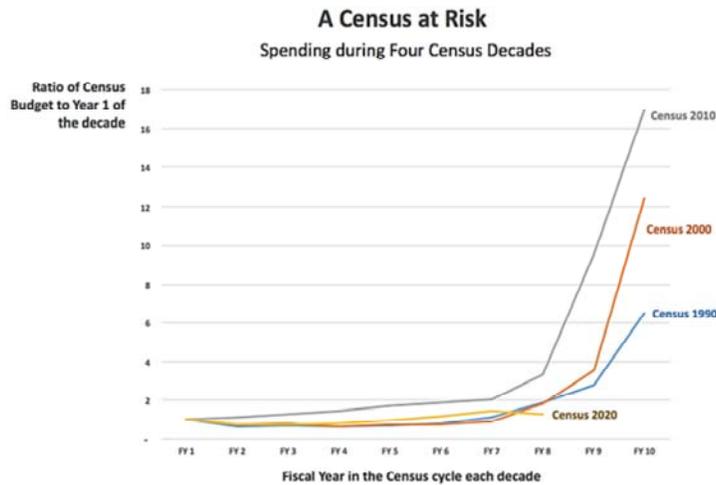

UMASS DONAHUE INSTITUTE

4

Here's an example. This is the Massachusetts Mills in Lowell, MA, a conversion that could be easily missed in Census canvassing efforts. (Read slide)

“A Census at Risk”

*2018 figure from Office of Management & Budget (OMB), as reported by the Washington Post

The Census Project

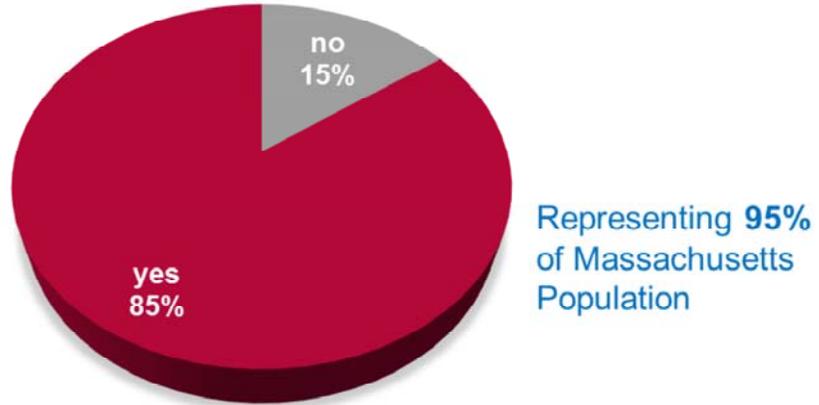

UMASS DONAHUE INSTITUTE

5

It's also worth noting that Census spending for this cycle is lagging behind other decades to a concerning degree. While in previous decades funding has already started to ramp up by the 8th year in the decade, so far the Census operational budget has been virtually flat-lining. This puts Census planning and testing behind schedule, and it means that local and state participation is more critical than ever to support a successful Census count in Massachusetts.

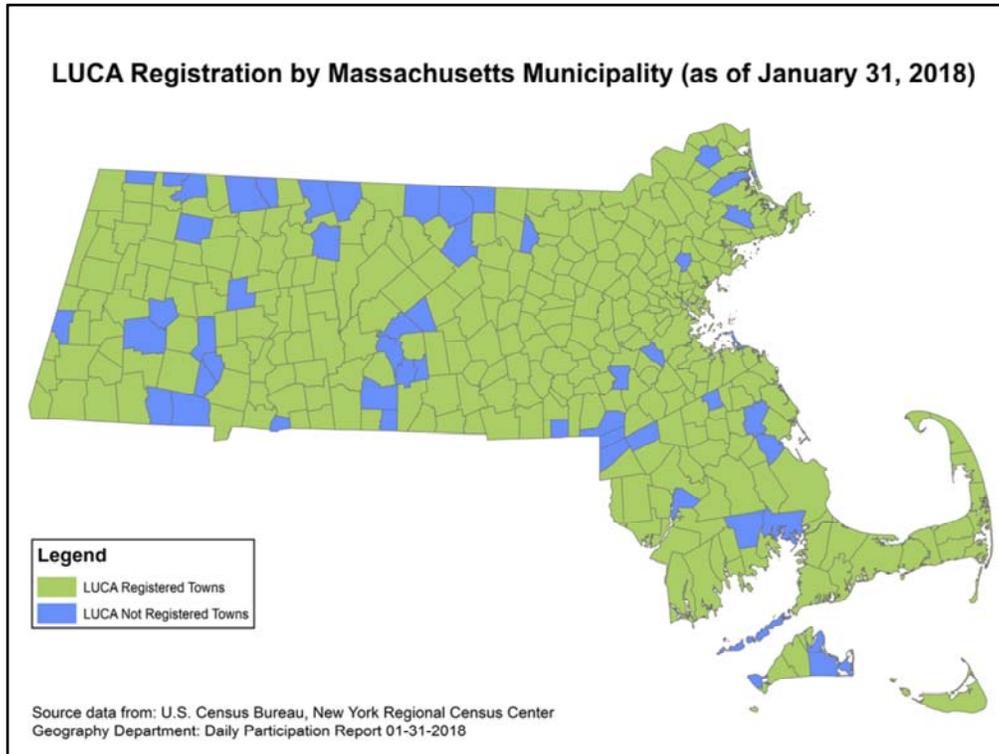

LUCA 2020 Registration in Massachusetts

298 out of 351 Massachusetts Municipalities

LUCA Participation Map

Overall Massachusetts has seen a remarkably strong response in LUCA registration, with towns representing more than 95% of the Commonwealth's population participating

UMDI Census 2020 Preparation

- UMDI created a statewide residential address list to compare against Census Master Address File
- Leveraged and consolidated existing statewide resources into LUCA-ready resources for towns

MassGIS

Data

Voter
Address
Lists

^ The Donahue Institute has been working to develop a statewide list of residential addresses using **three primary address databases.....**

UMDI LUCA Resources: Two Products

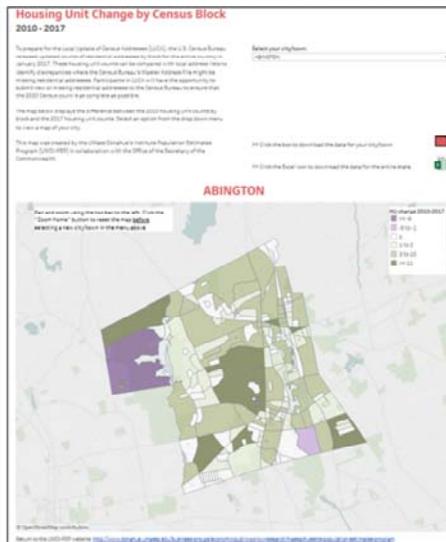

The two products look similar, but are made up of different data sources to be used in different ways.

^ Thing 1 shows you housing unit counts from 2010 compared to housing unit counts in the current Census Master Address File - by Census block

^ Thing 2 shows you the Census Master Address File counts for 2017 compared the addresses that we have for each block in the statewide address list that we have been developing

^ Use thing 1 to see where the Census Bureau has or has not captured residential growth since 2010 in your town and if you find trouble spots, start to assemble address lists for those areas

UMDI LUCA Resource #1 “Thing One”

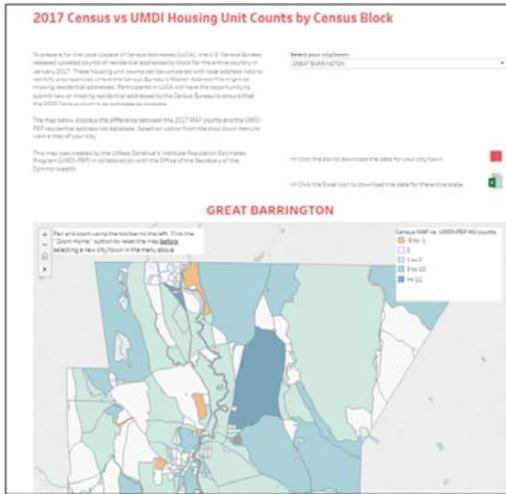

- Online interactive with Excel download option
- Census 2010 housing units vs. 2017 housing units
- Lets towns see where Census has or has not captured recent growth at the town and census block level.

When you look at these comparisons, ask whether Census seems to have captured growth since 2010 where you expected them too. If not, these are your focus areas. Start compiling address lists for these neighborhoods using whatever resources you have available to you.

UMDI LUCA Resource #2 “Thing 2”

- Census 2017 housing units vs. UMDI (state-sourced) 2017 housing units
- Allows towns to identify priorities: Blocks where Census missing the most
- **Request corresponding Excel address files from UMDI** (geodatabase format available upon request)

A second resource allows for current comparisons of our housing unit counts versus what the Census counts in their Master Address File.^

Goals:

- **Identify Where Census has missed addresses**
- **Prepare Review-Ready Files**

GUPS TOOL

The screenshot displays the GUPS TOOL interface. At the top, the title bar reads "GUPS TOOL - LOCAL - GUPS". Below the title bar is a menu bar with options: File, View, Layer, Settings, Window, Status, Help, Processing, Help, GUPS. A toolbar with various icons is located below the menu bar. The main area is divided into several panels:

- Map Panel:** Shows a street map with blue markers. A red box highlights a specific area on the map.
- Address List Panel:** A table with columns: BLOCK, GEOID, Only #, Cum #, Local #. It lists various address blocks and their corresponding counts.
- Local Address List Panel:** A table with columns: Address, City, State, Zip. It lists local addresses.
- Census Address List Panel:** A table with columns: House #, Street Name, Apt/Unit. It lists census addresses.

A red box highlights a section of the Local Address List and Census Address List panels. A red arrow points to the "Local Address List and Census Address Lists both loaded" text. The text "Local Address List and Census Address Lists both loaded" is written in red.

Coordinate: -77.1470, 38.4765 Scale: 1:1,000

GUPS TOOL

The screenshot displays the GUPS TOOL interface. At the top, the title 'GUPS TOOL' is shown in red. Below the title is a menu bar and a toolbar. The main area is divided into three sections: a map on the left, a data table in the center, and a sidebar on the right. The map shows a street grid with house numbers and years (e.g., 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021). A red box highlights a specific row in the table, which corresponds to a location on the map. A red text box points to this row with the text 'displayed in table and on map'.

Can easily compare Local HU counts vs. Census HU counts by block

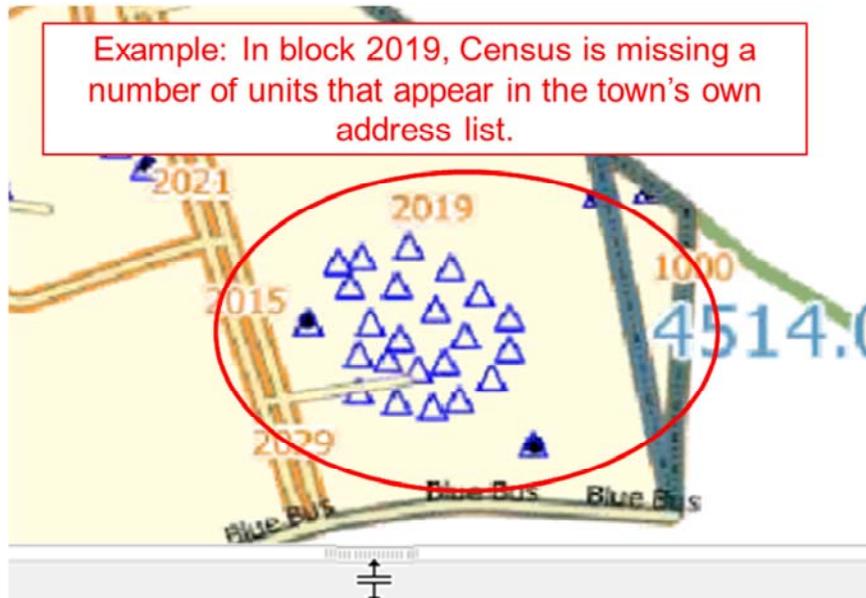

GUPS TOOL

GUPS TOOL

Example: In block 2019, Census is missing a number of units that appear in the town's own address list.

Goals:

Identify Where Census has missed addresses

- Use “Thing1” resource and other resources to check status of new growth areas

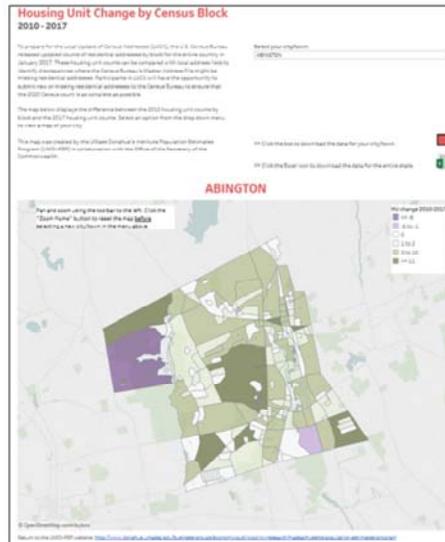

Prepare Review-Ready Files

- Add any missing addresses/new growth to “Thing 2” UMDI address lists
- Check that address list is de-duplicated and ready to load up

Check New Growth Using “Thing 1”

- Navigate to your town
- Compare to your **new growth** areas
- Compare visually via map compare or through address lists
- Download 2010-2017 growth by block file
- To compare address lists you may need to geocode your addresses first!

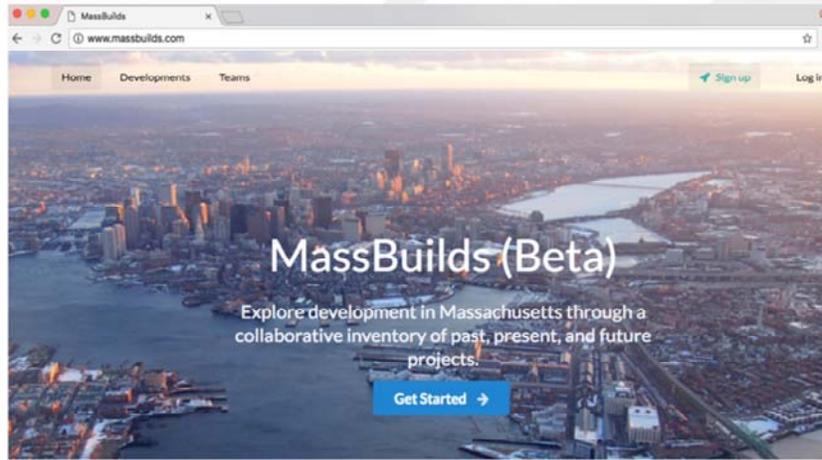

Preparing Review-Ready Files: New Growth

Comparing Assessor's Housing Growth with Census

The screenshot shows a web browser window displaying the City of Methuen, Massachusetts Property Assessment Data website. The page has a blue header with a navigation menu and a search form. The main content area features the City of Methuen seal and the following text:

The City of Methuen, Massachusetts
Property Assessment Data
City of Methuen
Board of Assessors
41 Pleasant Street, Suite 103L
Methuen, MA 01844
Phone: 978-963-8530 - Fax: 978-963-8962
Hours: Monday - Thursday 8:00a.m. to 4:30p.m.
Friday 8:00a.m. to 12:00p.m.
Welcome to the City of Methuen Massachusetts property assessment data.
The information provided on this site is reflective of the current Fiscal Year 2018 committed data. This would reflect any structural changes made to properties as of June 30, 2017. The values are based upon calendar year 2016 sales data. Assessments reflect the market value as of January 1, 2017.
The tax rates for Fiscal Year 2016 are:
Residential: \$14.27/\$1,000 and CIP: \$28.11/\$1,000
Some property information may have been changed after this listing was released. Changes resulting from database corrections, abatements.

In order to make sure that new developments have been captured in US Census data, let's go to our municipal assessor's data and pull up all new developments since the last census.

Here we see a fairly typical PatriotProperties assessor database for the City of Methuen.

Comparing Assessor's Housing Growth with Census

Within these listings, you will usually find new developments with relative ease from multiple addresses on the same street

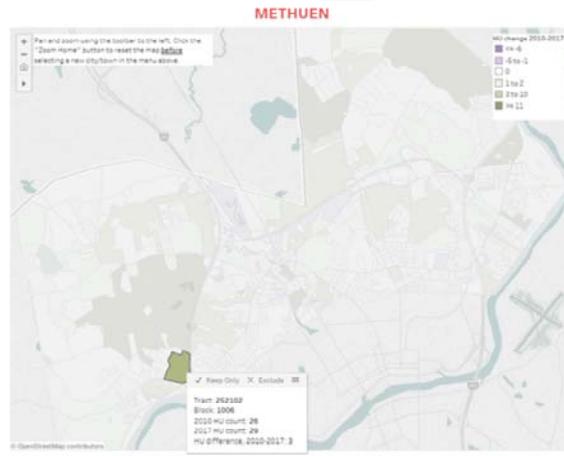

Comparing Assessor's Housing Growth with Census

To compare these with Thing 1, our dashboard showing Housing Unit Changes, we'll go to Google Maps and locate this street of new development properties.

Comparing Assessor's Housing Growth with Census

As you can see, the Housing Unit count for that census block has seen growth, however it shows 3 new housing units, rather than the 9 that returned in the assessor's database.

In the dashboard, select the town in question in the dropdown menu, and then after finding the location of your development, hover your mouse over that census block or click on it to display the data associated with that area-

Preparing Review-Ready Files: New Growth

Possible Town Sources of New Growth:

- Development Lists or websites
- Internet research
- **Assessor's Data - Excel File Format**

Can also use this to supplement UMDI address lists if more current!

Look for largest discrepancies. Focus on these blocks.

Request UMDI address list OR use your own address list

I need a copy of my address list!

We can send you the **UMDI** address list compiled from state sources to get you started.

...make sure your address list includes unit designators and assign blocks if you want to make comparisons!

Census will send your official LUCA review list in February!

Source: One Fish Two Fish Red Fish Blue Fish, by Dr. Seuss

UMASS DONAHUE INSTITUTE

58

You can request a list of addresses for that block (or your entire town) or you can use your own list. Just make sure that your list also includes Census block names. Just remember, the address list we will send you is the UMDI list that we have been assembling using state data sources. It is NOT the Title 13-protected LUCA address list that Census will send to you in February. Census will send that to you directly once the review period officially begins.

Now, take your detailed address list and use the blocks you identified as priority blocks, and filter your address by the priority blocks.

Review and Prepare Addresses

- 1) Remove duplicates
- 2) Check unit designations
- 3) Check residential status
- 4) Supplement with missing data

UM_ID	ADD_NO	STREET	SUBADDRESS	ZIP	CITY	BLOCK_GEOID_2010	LAT	LONG	TYPE	USE_CODE
1278498	1	SCHOOL STREET	1	02474	ARLINGTON	25_013_813601_1024	42.427114	-71.186566	Residential	102
1278503	1	SCHOOL STREET	3	02474	ARLINGTON	25_013_813601_1024	42.427114	-71.186566	Residential	102
1278504	1	SCHOOL STREET	4	02474	ARLINGTON	25_013_813601_1024	42.427114	-71.186566	Residential	102
1278505	1	SCHOOL STREET	5	02474	ARLINGTON	25_013_813601_1024	42.427114	-71.186566	Residential	102
1278506	1	SCHOOL STREET	6	02474	ARLINGTON	25_013_813601_1024	42.427114	-71.186566	Residential	102

Once you are looking at just your priority block,

- 1) Remove duplicates
- 2) Check unit designations
- 3) Check residential status
- 4) Supplement with missing data
- 5) Format to Census specifications

2: Comparing Address Lists

To add updated data to LUCA for 2020, you'll want to convert your L3 data to an acceptable format for the US Census.

For the purpose of making our dashboards and other tools online, UMDI data uses a format which is compatible for LUCA purposes.

2: Comparing Address Lists

In this section we'll cover—

- Converting files from Excel ↔ .CSV
- Concatenating/de-concatenating
- Standardizing data fields
- Finding duplicate records

In this part of the presentation I will be showing you some of the ways you can use Excel as a multi-tool for ensuring data is correct, in the proper format and usable by the **Local Update of Census Addresses** Operation, better known as LUCA 2020.

“Comma separated values”

Frequently-used delimiters include

↔ ; , | _ -

CSVs, known in full as “comma separated values” files, are especially useful for storing large sets of information in a small text-based format. Tables are stored as plain text, with cells separated or “delimited” by a single non-alphanumeric character, usually commas, but alternately delimiters can be tabs, semicolons, commas, vertical lines, or a number of other symbols

Converting Excel files to CSV and back

Housing Unit Change by Census Block 2010 - 2017

To prepare for the Local Update of Census Addresses (LUCA), the U.S. Census Bureau released updated counts of residential addresses by block for the entire country in October 2017. These housing unit counts can be compared with local address lists to identify discrepancies where the Census Bureau's Master Address File might be missing residential addresses. Participants in LUCA will have the opportunity to submit new or missing residential addresses to the Census Bureau to ensure that the 2020 Census count is as complete as possible.

The map below displays the difference between the 2010 housing unit counts by block and the 2017 housing unit counts. Select an option from the drop-down menu to view a map of your city.

This map was created by the UMass Donahue Institute Population Estimates Program (DIP-PEP) in collaboration with the Office of the Secretary of the Commonwealth. If you have questions about this dashboard, please contact Meghan Flanagan (MFlanagan@donahue.umass.edu) or Matt Schliker (MSchliker@donahue.umass.edu).

Select your city/town:

CHICOPEE

Click the icon to download the data for your city/town.

Click the Excel icon to download the data for the entire state.

CSV files are also the format that our dashboard data is stored, again if you would like to download this data, you can do so by clicking the red button in or

Converting Excel files to CSV and back

Importing CSV files

To do this, we'll open a blank workbook, go to the Data tab and click the "From Text" button in the "Get External Data" menu. Navigate to the folder containing your CSV file

Converting Excel files to CSV and back

Importing CSV files

Text Import Wizard - Step 1 of 3

The Text Wizard has determined that your data is Delimited.
If this is correct, choose Next, or choose the data type that best describes your data.

Original data type

Choose the file type that best describes your data:

- Delimited - Characters such as commas or tabs separate each field.
- Fixed width - Fields are aligned in columns with spaces between each field.

Start import at row: 1 File origin: 437 : OEM United States

My data has headers.

Preview of file C:\Users\kiefebvre\Downloads\MA_HU_Change_2010_2017.csv

```

You'll be able to see if your import will be a success in the data preview.

Converting Excel files to CSV and back

Importing CSV files

[Animation, fade in ZIP]

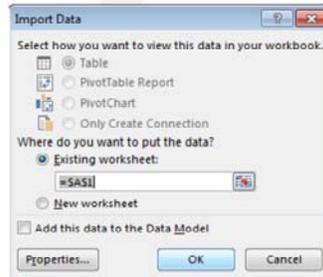

When importing CSV files for Census or other property data, it is generally a good idea to convert your fields to text, particularly any numeric fields, as leading zeros such as those in a ZIP code (or in this case the county code) will be removed if you import your data as in a “General” format.

Making these values into text means any formulas we enter into these cells will be treated as text rather than formulas, so while we may need to convert some other columns to the “General” format later, this is generally a good practice to ensure that no data is lost.

Converting Excel files to CSV and back

Importing CSV files

After clicking Finish, the Import Data window will prompt whether you want to add this to an existing worksheet or create a new one. In this case we'll use the default value for the existing worksheet, as our workbook is blank.

Now that our CSV is imported, we can save it with any formatting changes like highlighting, font, etc.; features that would otherwise be lost as a CSV file.

Converting Excel files to CSV and back

Saving CSV files from Excel is very simple; all you have to do is go to File>Save as, and in the file format dropdown, select CSV (Comma delimited). You'll need to convert your Excel files back into CSVs in order to work with GUPS (Geog. Update Partnership Software)

Concatenating and De-concatenating

Concatenating Fields

De-concatenating Fields

In this next section we'll cover concatenating and deconcatenating fields; concatenation is especially useful for addresses, as it allows numbers, streets, and zip codes to be reorganized as one field or to be placed in separate fields

Concatenating and De-concatenating

=CONCATENATE ([CELL] , [CELL] ,)

=CONCATENATE ([CELL] , "TEXT STRING" , [CELL])

The screenshot shows an Excel spreadsheet with a formula bar at the top containing the formula `=CONCATENATE(A2,"",B2,"",C2)`. Below the formula bar, there are two views of the spreadsheet. The first view shows the data before the formula is applied, with columns A (Number), B (Route Name), and C (Route Type). The second view shows the result of the formula, where column D (Address) contains the concatenated text from columns A, B, and C, separated by spaces.

	A	B	C	D	E	F
1	Number	Route Name	Route Type	Address		
2	99	WATER	ST	2,"",C2)		
3	99	MIDDLE WATER	ST			

	A	B	C	D	E
1	Number	Route Name	Route Type	Address	
2	99	WATER	ST	99 WATER ST	
3	99	MIDDLE WATER	ST		

Even if you have no prior experience, concatenating addresses is very easy in Excel. To do this, all you need to do is select a blank column for your formula, and then type in =CONCATENATE(This initiates the concatenate formula, once you've typed in the end parenthesis, hold CTRL and click on any number of cells to put them together. To add a space between cells you will have to enter it in manually between their names, with two quotation marks. So for example if I wanted to concatenate a street name with a municipality with a space in between them, I would enter =CONCATENATE(N2, "", P2).

Concatenating and De-concatenating

? Troubleshooting

	A	B	C	D	E
1	Number	Route Name	Route Type		Route Type
2	99	WATER	ST	#VALUE!	ST
3	99	MIDDLE WATER	ST		

	A	B	C	D	E
1	Number	Route Name	Route Type		
2	99	WATER	ST	=CONCATENATE(A2,	
3	99	MIDDLE WATER	ST		

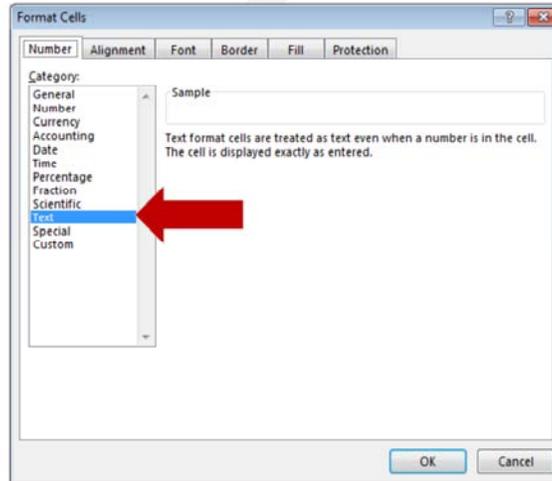

If the =CONCATENATE() function doesn't work, double check that you've used commas between cells rather than pluses (+) or any other operative symbols. Additionally, make sure you have "quotations" on both sides of your spaces or other text that you'd like to add.

Concatenating and De-concatenating

Troubleshooting

Some common problems, if your function is displaying on its own rather than returning the correct value, this could be because the cells it is entered in are formatted as text. To change this simply right click on the column, row, or cells in question and select Format Cells. There you will be able to change the format from text to “General”, after doing this, double click on the cells in question and press enter to reactivate the formula, which should allow the function to return a value.

Concatenating and De-concatenating

The Challenges of De-concatenating

Text to Columns: useful but with limitations-

Text to Columns
Split a single column of text into multiple columns.

For example, you can separate a column of full names into separate first and last name columns.

You can choose how to split it up:
fixed width or split at each comma, period, or other character.

[Tell me more](#)

	A	B	C	D	E	F	G
1	Address	NewField1	NewField2	NewField3	NewField4		
2	99 WATER ST		99 WATER	ST			
3	99 MIDDLE WATER ST		99 MIDDLE	WATER	ST		
4							
5							
6							
7							
8							

Now we'll move on to de-concatenation, to separate spaced information like addresses, we could use Text to Columns, however one limitation of this tool is that it will cause problems where streets have multiple words in their names

Concatenating and De-concatenating

=LEFT() and =RIGHT() can be used for numbers and street types but may cause confusion with irregular addresses

	A	B	C
1	Address	NewField1	NewField2
2	99 WATER ST	99	ST
3	99 MIDDLE WATER ST	99	ST
4	SHERI LANE ESTATES	SH	ES
5			

One alternative for this is the LEFT() and RIGHT() functions to place the first and last number of characters into another cell. Again this has limitations as irregular addresses beginning and ending with words may become unrecognizable with this tool. E.g. whereas 99 WATER STREET yields 99 and ST, SHERI LANE ESTATES gives us SH and ES.

Concatenating and De-concatenating

An alternative-- "nested formulas", provided with this lecture-

First word/numbers of address-

```
=TRIM(LEFT(SUBSTITUTE(A2," ",REPT(" ",100)),100))
```

Middle words (e.g. 99 Middle Water Street)

```
=MID(A2,FIND(" ",A2)+1,FIND(CHAR(1),SUBSTITUTE(A2," ",CHAR(1),LEN(A2)-LEN(SUBSTITUTE(A2," ",""))))-(FIND(" ",A2)+1))
```

Last word/street type-

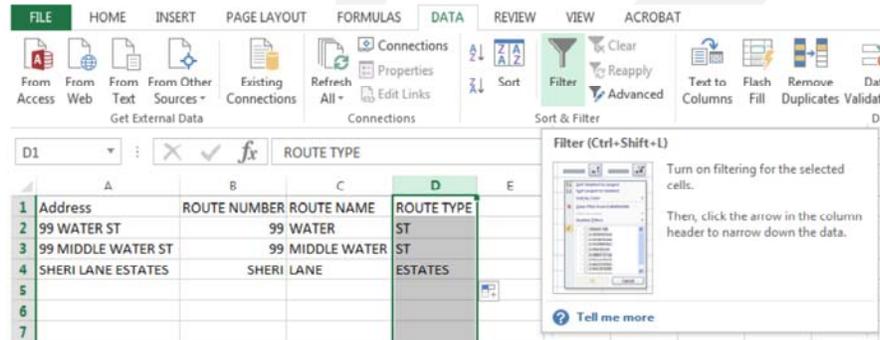

```
=TRIM(RIGHT(SUBSTITUTE(A2," ",REPT(" ",100)),100))
```

Using the combination of TRIM SUBSTITUTE formulas provided above will allow you to extract the entire first, middle, and last words, including any irregular street names or suffixes. Note the text in green represents the cells that you would change out depending on the location of your address information. We will provide a template Excel file with these formulas already entered in an example to make things easier for everyone.

Concatenating and De-concatenating

Irregular addresses remain, but become more easily identified with filtering-

The screenshot displays the Microsoft Excel interface with the 'DATA' tab selected. The ribbon includes options for 'Filter', 'Sort', 'Text to Columns', 'Flash Fill', 'Remove Duplicates', and 'Data Validation'. A data table is visible with the following content:

	A	B	C	D	E
1	Address	ROUTE NUMBER	ROUTE NAME	ROUTE TYPE	
2	99 WATER ST		99 WATER	ST	
3	99 MIDDLE WATER ST		99 MIDDLE WATER	ST	
4	SHERI LANE ESTATES		SHERI LANE	ESTATES	
5					
6					
7					

The 'ROUTE TYPE' column (D) is highlighted in green. A 'Filter (Ctrl+Shift+L)' dialog box is open, showing a list of filter criteria and instructions: 'Turn on filtering for the selected cells. Then, click the arrow in the column header to narrow down the data.' The 'Tell me more' link is also visible.

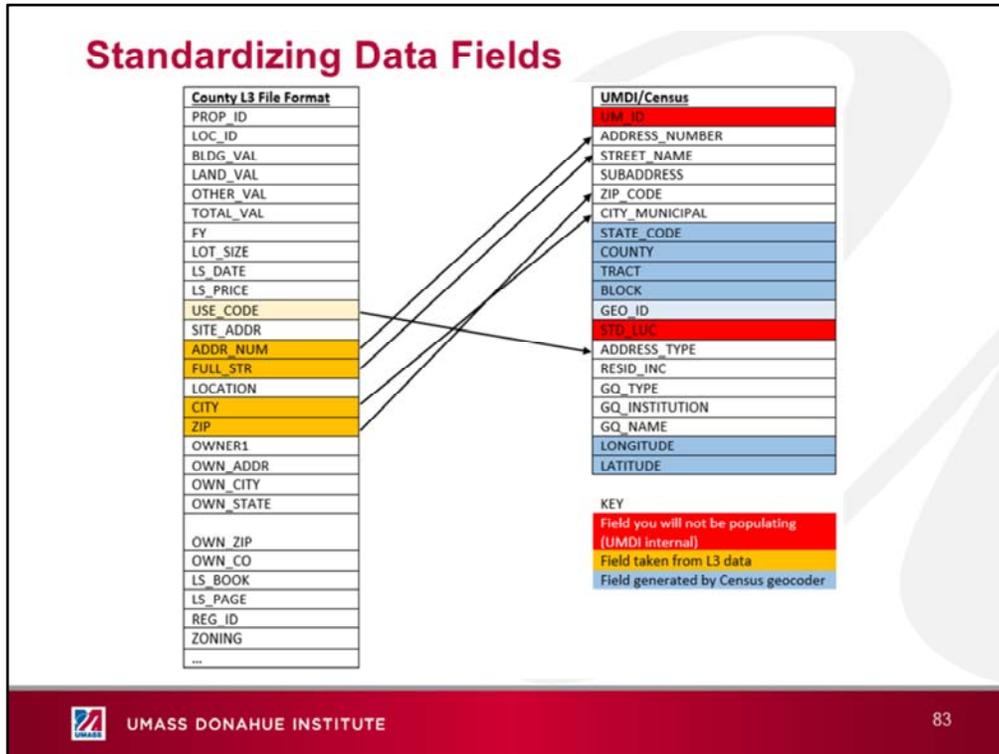

After processing data with these operations, we can filter for unusual addresses by selecting our column, going to the data tab and clicking the filter button.

Concatenating and De-concatenating

A column with a filter is indicated by an arrow button on the right side of the first cell in the column in question. As you can see, any suffixes like street, road, or any irregularities will be listed.

If your municipality is working with GUPS, the Census Bureau's Geographic Update Partnership Software (GUPS), you'll want to standardize your L3 assessors data into a format which mimics that of the Census's. In creating Dashboard 2, which shows counts of group quarters (GQ) and individual housing units, UMDI has attempted to make formatting that is compatible with this.

Standardizing Data Fields

Census Geocoder Input Format

The screenshot displays the United States Census Bureau Geocoder interface. At the top left is the United States Census Bureau logo. A navigation bar contains four categories: Topics (Population, Economy), Geography (Maps, Products), Library (Infographics, Publications), and Data (Tools, Developers). The main content area is divided into three sections: 'FIND LOCATIONS USING...' with options for One Line, Address, and Address Batch; 'FIND GEOGRAPHIES USING...' with options for One Line, Address, Address Batch, and Geographic Coordinates; and 'ABOUT DATA...' with options for Benchmarks and Vintages. On the right, there are input fields for 'Select Address File' (with a 'Choose File' button and 'Addresses (1).csv' text), 'Benchmark' (a dropdown menu set to 'Public_AR_Current'), and 'Vintage' (a dropdown menu set to 'Current_Current'). Below these fields, a note states 'Batch files may not exceed 10000 records.' and there is a 'Get Results' button. A link 'Download a sample CSV file here' is also present.

Geocoder – standardizing your address list

- **The first step in the batch geocoding process is to standardize your municipal address list to Census specifications.**

Note: Your data must be standardized to Census guidelines or the geocoding tool will not work properly.

- **For detailed instructions on how to set up your address list columns for processing, see this link:**

<https://www.census.gov/geo/maps-data/data/geocoder.html>

Census Geocoder

For governments interested in the Local Update of Census Addresses Operation block count lists, they can be found on the [2020 Census LUCA webpage](#).

The **Census Geocoder** is an address look-up tool that converts your address to an approximate coordinate (latitude/longitude) and returns information about the address range that includes the address and the census geography the address is within. The geocoder is available as a web interface and as an API (Representational State Transfer - REST - web-based service).

The tool allows you to look-up a single address or batch submit up to 10,000 addresses at a time. In addition, you can find the location of an address, the latitude and longitude, using the "Find Locations Using..." option. You can also find the census geographic entries for an address using the "Find Geographies Using..." option. The "Find Geographies Using..." option returns the state, county, census tract, and block for each address. Additional geographies are available using the instructions under Documentation below.

When geocoding your address, you need to select a benchmark (time period) and select a vintage of geography. The benchmark is the time period when we created a snapshot of our data (generally done twice a year). For example, Public_AR_Census2010 is the snapshot we took of the database in 2010. Public_AR_Current is the most recent snapshot we took of our dataset. The vintage of geography is the census or survey that the data relates to. For example, Cenau2010_Census2010 are the address ranges from the 2010 Census at the time of the 2010 Census. You can also obtain the 2010 Census address ranges as of our most recent benchmark. The vintages you see available depends on the benchmark you selected.

Finding Duplicate Records

The simplest, but not the most effective way to handle large datasets-

Instead, we'll use the concatenation function we covered earlier in this presentation.

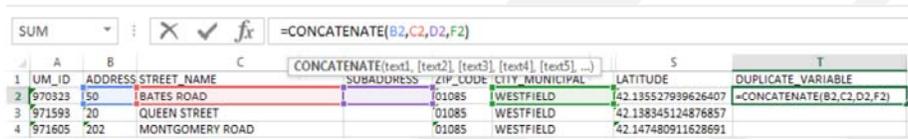

If you have the time and patience, sorting and filtering can be useful tools for looking through data for duplicate entries. However if you want to find all duplicate addresses quickly, you can do this with a combination of concatenations and pivot tables.

Finding Duplicate Records

We'll create a "duplicate variable" which will be populated by a concatenation of-

- Address Number
- Street Name
- Subaddress
- Municipality

The screenshot shows an Excel spreadsheet with the following data:

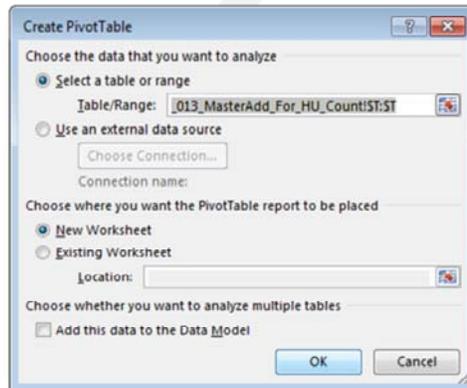

1	UM_ID	ADDRESS	STREET_NAME	SUBADDRESS	ZIP_CODE	CITY_MUNICIPAL	LATITUDE	DUPLICATE_VARIABLE
2	970323	50	BATES ROAD		01085	WESTFIELD	42.135527939626407	=CONCATENATE(B2,C2,D2,F2)
3	971593	20	QUEEN STREET		01085	WESTFIELD	42.138345124876857	
4	971605	202	MONTGOMERY ROAD		01085	WESTFIELD	42.147480911628691	

No spaces need to be used, as this is a "dummy variable"

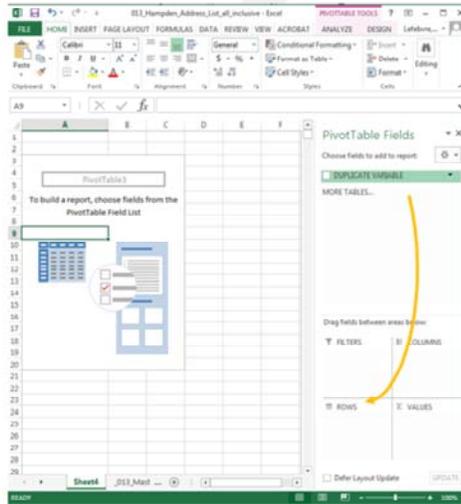

First we'll make a new "dummy field" in which we'll concatenate our address data so we have the street number, name, subaddress (units, etc.), and town in one column. No spaces between fields will be necessary.

Finding Duplicate Records

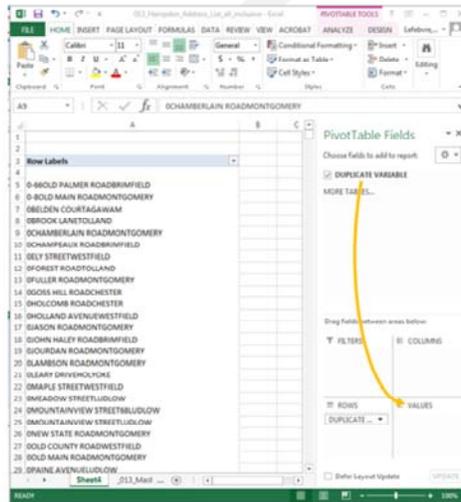

Leave the table/range as default, and choose the PivotTable to be placed on a New Worksheet

Finding Duplicate Records

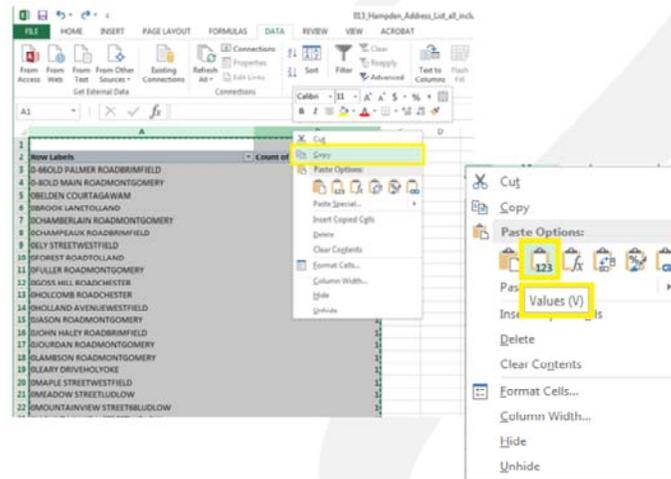

In the PivotTable Fields menu, if it's not already populated, click and drag set the one field you generated to the Rows and Values sections, leaving the latter as the default "Count of [FieldName]"

Finding Duplicate Records

Finding Duplicate Records

After the PivotTable has generated, select both its columns and copy them. Make another worksheet and then right-click to Paste Options>Values (Ctrl-V will not do this).

Finding Duplicate Records

The screenshot shows the Microsoft Excel interface. The 'DATA' tab is active, and the 'Sort & Filter' group is highlighted. A 'Sort Warning' dialog box is open, displaying the following text:

Sort Warning

Microsoft Excel found data next to your selection. Since you have not selected this data, it will not be sorted.

What do you want to do?

- Expand the selection
- Continue with the current selection

Buttons: Sort, Cancel

The background spreadsheet shows a table with the following data:

Row Label	Count of DUPLICATE_VARIABLE
D-BOLD P	1
D-BOLD M	1
D-BELDEN	1
D-BROOK L	1
D-CHAMBER	1
D-CHAMPE	1
D-ELY STRE	1
D-FORREST	1
D-FULLER R	1
D-GOSS H	1
D-HOLCOM	1
D-HOLLAND	1

If prompted to expand your selection, keep the default option and click Sort.

Finding Duplicate Records

Row Label	Count of DUPLICATE_VARIABLE
101	670AK STREETSPRINGFIELD
102	69QUARTUS STREETCHICOPEE
103	71CHESTNUT STREETSPRINGFIELD
